## 1.6 SOLUTIONS OF LINEAR SYSTEMS OF EQUATIONS

In this section we shall systematize the familiar method of elimination of unknowns (discussed in Section 1.1) for the solution of linear systems and thus obtain a useful method for solving such systems. This method starts with the augmented matrix of the given linear system and obtains a matrix of a certain form. This new matrix represents a linear system that has exactly the same solutions as the given system but is easier to solve. For example, if

$$\left[ \begin{array}{cccc|c} 1 & 0 & 0 & 2 & 4 \\ 0 & 1 & 0 & -1 & -5 \\ 0 & 0 & 1 & 3 & 6 \end{array} \right]$$

represents the augmented matrix of a linear system, then the solution is easily found from the corresponding equations

$$\begin{aligned} x_1 + 2x_4 &= 4 \\ x_2 - x_4 &= -5 \\ x_3 + 3x_4 &= 6. \end{aligned}$$

The task of this section is to manipulate the augmented matrix representing a given linear system into a form from which the solution can easily be found.

An  $m \times n$  matrix  $A$  is said to be in reduced row echelon form if it satisfies the following properties:

- All zero rows, if there are any, appear at the bottom of the matrix.
- The first nonzero entry from the left of a nonzero row is a 1. This entry is called a leading one of its row.
- For each nonzero row, the leading one appears to the right and below any leading one's in preceding rows.
- If a column contains a leading one, then all other entries in that column are zero.

A matrix in reduced row echelon form appears as a staircase ("echelon") pattern of leading ones descending from the upper left corner of the matrix. An  $m \times n$  matrix satisfying properties (a), (b), and (c) is said to be in row echelon form.

Proceed as follows:

$$A-B = A + (\text{inverse of } B) \quad B = A+1B = A+B$$

$$A-B = A+B.$$

Note:- A bit is a binary digit i.e either 0 or 1
